AD Integration Services

Active Directory without the need to bind.

AD Integration Services help your IT team provide Mac users with a secure connection to an Active Directory (AD) domain and resources.

Designed for one-to-one deployments, this helps you access single sign-on services, such as file shares, printers, SharePoint, or any other Kerberos-enabled service. You can also automatically reestablish the SSO trust to AD when your Mac connects to the network, and can even keep your local Mac password in sync with your AD password.

Compatibility	macOS 10.11 (or later), Active Directory 2008 (or later)
Availability	From Apple Professional Services for Enterprise, Government, and Education

Enable your Mac users—easily.

With AD Integration Services, you can help your Mac users access AD resources—without binding the Mac to AD and without users calling IT. When you purchase AD Integration Services, an engineer will join you remotely or at your location to provide valuable insights on deploying Enterprise Connect based on your current AD implementation. The engineer will help you develop the deployment plan, assist with creating scripts, and coach you on new features and best practices.

Ordering information

Contact your Apple Authorized Reseller, Apple representative, or consultingservices@apple.com for more information and pricing.

Kerberos single sign-on

- Automatically acquire and renew a Kerberos Ticket Granting Ticket
- Authenticate to Kerberos-enabled services
- Connect to file shares, print queues, etc.
- Leverage local and/or AD mobile accounts

Password management

- Change your AD password directly from Enterprise Connect or redirect to a web-based identity management system
- Display password requirements with live validation during password changes
- Notify users when their passwords will expire via Notification Center, even while offline
- Sync Mac login password with AD password

Network share management

- Mount each user's home directories
- Mount explicit shares, such as group shares
- Remount shares automatically
- Support for SMB, AFP, or DFS[1]

Customization and automation

- Execute custom scripts at specific triggers
- Audit script to ensure security compliance before every AD authentication
- Connection completed script performs an action after every connection to AD
- Password change script runs after the AD password is changed

Localization and Support

- Localized for over 30 countries
- Support via AppleCare OS Support or AppleCare for Enterprise agreement
